

Ambulance stretcher with Trendelenburg h687_25

Ambulance stretcher with steel frame and Trendelenburg anti-shock position. Capacity: 170 kg. Safe bar reclining side rails.

The ambulance stretcher is a self-loading stretcher for patient transport. It can be used for rescue operations on the road and on medical vehicles. The legs fold independently, by operating the specific controls, during loading, and open automatically during unloading.

The self-loading stretcher features a steel frame with an easy-to-sanitize polyethylene platform and a backrest adjustable in 5 positions in addition to the horizontal one.

The Safe bar reclining side rails allow the patient to be transferred safely and effortlessly, while the leg locking system in the closed position allows it to be lifted like a small stretcher.

The transport of the stretcher is facilitated by the presence of 2 fixed wheels and 2 swivel wheels with brakes on the rear wheels.

Technical features:

- Frame material: steel
- Polyethylene platform
- Color-coded controls
- Trendelenburg anti-shock position
- Reclining side rails
- Capacity: 170 kg
- Length: 1980 ±10 mm
- Width: 570 ± 10 mm
- Weight: 40 ± 1 kg
- Wheels: ø200 mm
- Side rail length: 680 mm
- Side rail height: 200 mm
