

Anti-decubitus air mattress 20 elements h230_107

Anti-decubitus air system with digital compressor. 20 interchangeable elements.

The **anti-decubitus system**, consisting of a **digital compressor** with **pressure regulation** and an **air mattress with interchangeable elements**, promotes, with the **alternating contact points** with the patient, blood circulation and **good tissue oxygenation, preventing the onset of pressure sores**. The **digital compressor** allows you to adjust the pressure **according to the patient's weight and the inflation/deflation cycle time**. Compact and quiet, it can be placed on the floor or hung on the bed rail thanks to two support hooks. **Two LED indicators**, one red and one green, highlight the type of pressure of the connected mattress (alternating/static) and an **acoustic alarm system** signals the lack of pressure. The compressor is also equipped with the **Static system** which **blocks alternating inflation** and transforms the connected mattress into a normal mattress, and the **Autofirm system** which keeps all elements inflated at **maximum static pressure**. The mattress is made of medical-grade PVC, subjected to antibacterial treatment. It consists of **20 interchangeable elements**, which **inflate alternately**, fixed with snap buttons, which facilitate eventual replacement in case of breakage and allow for cleaning. Eight central elements are provided with low air loss micro-holes to allow for a more comfortable and dry rest. The mattress is completed by four elastic bands at the corners that allow it to be anchored to the underlying mattress. It is equipped with a CPR Valve, which is used for the immediate deflation of the mattress for urgent resuscitation interventions. The **waterproof and breathable cover** is equipped with a zipper that runs along the entire perimeter of the mattress. Prevention of **pressure sores** in high-risk subjects.

Technical characteristics:

- 20 interchangeable elements
- Inflated dimensions: 200x90xh.20 cm
- CPR Valve
- Nylon/PVC cover
- Maximum supported weight approx 180 kg
- Adjustable alternating cycle
- Consumption: 7 W
- Fuse: 1 A
- Digital compressor dimensions: W.28xD.20.5xh.11 cm
- Acoustic alarm
- Static system (inflation block)
- Autofirm system that keeps the elements inflated at maximum static pressure
