

Isothermal emergency blanket h708_22

Thermal sheet for patient rescue operations. Dimensions: 160 x 210 cm. With layer for protection from heat and layer for protection from cold.

Emergency blanket ideal for use on patients involved in accidents, people missing due to natural disasters or homeless people. Thanks to the **2 layers of different colors it is equipped with**, it can be **used to protect against both heat and cold**. In particular, if used with the silver layer facing outwards and the green one facing inwards, it performs the function of protection from heat as the silver color deflects solar rays preventing them from reaching the skin, while the green layer on the inside facilitates the dispersion of body heat; if used instead with the silver layer facing inwards and the green one facing outwards, it ensures the maintenance of body heat inside.

Technical features:

- Dimensions: 160 x 210 cm
- With 1 green layer and 1 silver layer
- For protection from cold: use with green layer facing outwards
- For protection from heat: use with silver layer facing outwards
